

SuperChems Reporter Writer

Symptoms:

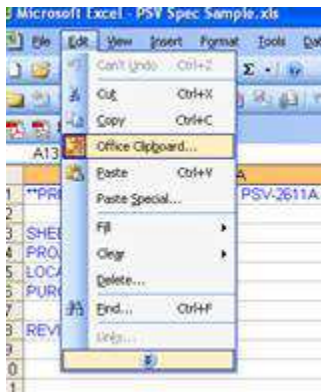

You consistently get the "Object not found" error whenever you view the device specification sheets, generate a report, or visit any input forms that display images. As a result, most of the report contents may be purged and cannot be generated.

Problems:

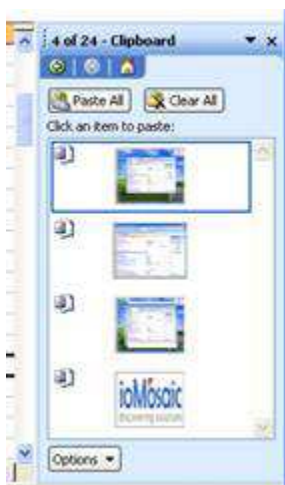

SuperChems uses the windows Clipboard as a staging station to store temporary images. Whenever SuperChems displays contents that have images AND the Excel (and possibly most of other Office applications) is open AND all options within the Office Clipboard are enabled, the Office application takes over and prevents SuperChems from displaying its contents correctly. As a result, you get the "Object not found" and possibly lose most of your report contents.

Solution:

1. Turn on your **Office Clipboard**, if the Office Clipboard is currently not on

2. Check on the **Options** located on the button of your clipboard

3. Uncheck all the options

The desired options should look like following images:
